

Impact of Data Quality on Synchro- Waveform Data Analytics

July 19, 2023

Farnoosh Rahmatian, NuGrid Power Corp

Outline

- Start with the end in mind
- Synchro waveforms application analytics types
- Data quality issues
- Examples

Synchro waveforms application analytics

Still very young

- Edge Applications
 - Operating on data locally at the grid edge
 - Can be the same as regular (non-synchro) waveform applications
 - Focus on measurement quality as opposed to data communications issues
- Distributed and Central Applications
 - Realtime and non-real-time applications
 - Relies on data communications infrastructure
 - Waveform resolution categories
 - 1-100/s Slow: synchrophasors (e.g., 25-120 per second)
 - 1k-10k/s Medium: harmonics power flow, high-impedance fault detection (1k to 20k per second)
 - 100k-1M+/s Fast: transients and travelling wave (100k – 1M per second)

Data quality issues

Different Types

- Measurement errors (inaccuracies)
 - Measurand errors (voltage, current, ...)
 - Time errors (timestamp errors)
 - Quality information (e.g., status info)
 - Trust level
- Data loss
 - Measurement instrument/sensor issues
 - Data transport issues
 - Data latency issues
 - Data storage issues

Data quality issues

Different Types

- Measurement errors (inaccuracies)
 - Measurand errors (voltage, current, ...)
 - Time errors (timestamp errors)
 - Quality information (e.g., status info)
 - Trust level
- Data loss
 - Measurement instrument/sensor issues
 - Data transport issues
 - Data storage issues

Examples

Example: Comparative Verification of Accuracy

12 kV Digitized Resistive-Divider Voltage System

Device Under test
Primary Sensors
(Combined resistive
divider and low-power
current transformer)

Reference Optical
Voltage Sensors

Example of Verification of Accuracy

12kV – 60 Hz and Harmonics

4.8 kHz
sampling rate

Example of Verification of Data Quality

12 kV Digitized Resistive-Divider Voltage System

Capacitor
Switching &
Slow Transients

4.8 kHz
sampling rate

High-Frequency Example

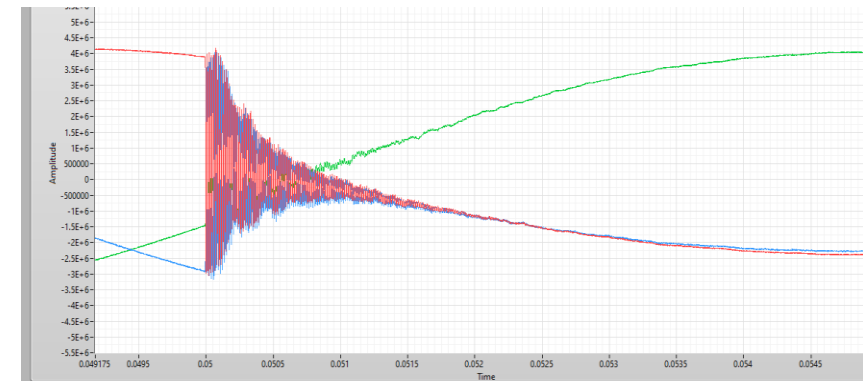

Impact of Data Rate

Fault Event

~ 6 ms window at the beginning of the event
Anti-alias filtered and sampled at 14.4 kHz

~ 6 ms window at the beginning of the event
Anti-alias filtered and sampled at 1 MHz

Zooming into the first 200 μ s window of the event (sampled at 1 MHz)

High-Frequency Example

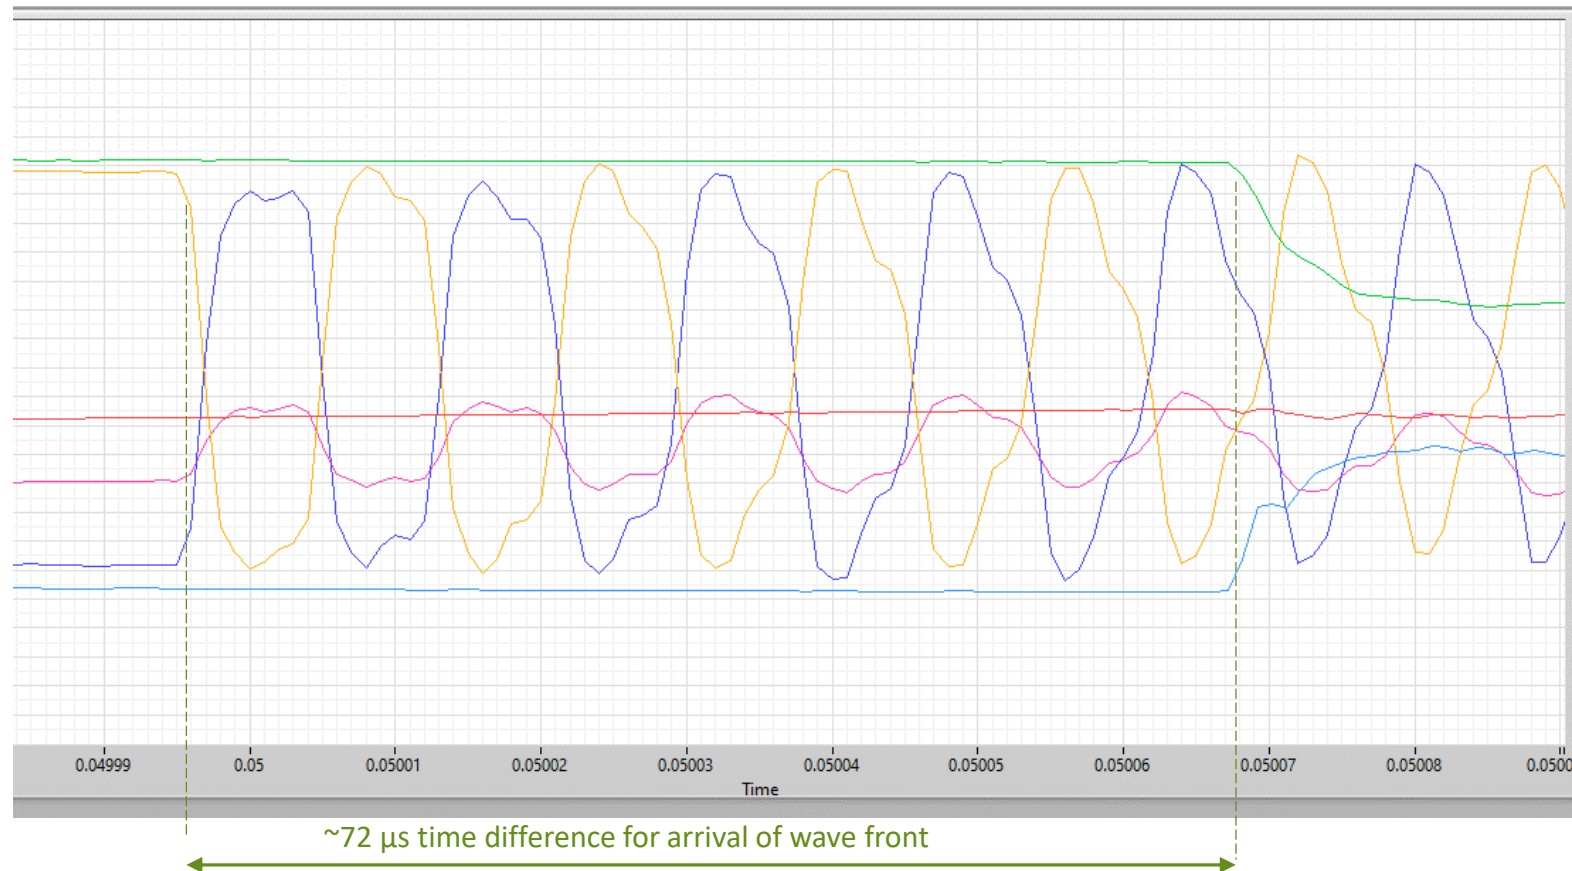

Event Comparison across the grid

121 μ s time difference
(Event propagation time)

High-Frequency Example

Event Travel Comparison and Data Rate
